If your computer crashes when trying to run a large program or multiple programs at the same time, you may need a larger amount of RAM. The operating system must always be up-to-date to ensure efficient operation. Any Å you need or want to run in the background at computer startup can be deselected from this list. Even the PC with the best scores will slow down while installing the software and downloading files using system resources, but you can help your computer run faster. Cleaning My PCYou can optimize your system by cleaning some important areas of your computer. You can schedule automatic updates to run when updates become available. Perform the Disk Cleanup process to remove all temporary files and unnecessary system files. Empty the Recycle Bin. Switch to the Program Manager and delete all programs you Å use. This may include programs pre-installed on the computer or some programs installed by the user. These programs use disk space, memory and processing power, so they should go. Open the Control Panel and type in Performance Information and Tools. Choose Adjust Visual Effects, then click on Å Remove or quarantine viruses that appear on the scan.
